Introduction

locifilemanager is a full-screen file manager for the LOCI mass storage device on the Oric Atmos home computer. It lets you browse, copy, move, delete, and rename files on LOCI-connected storage; mount and unmount disk, tape, and ROM images; and boot from mounted media.

This is version 2 — a complete rewrite using the Oscar64 C compiler targeting the 6502A bare-metal (no ROM calls). The v1 CC65 implementation is at `locifilemanager`.

Available in English and French.

Current status: Library infrastructure (charwin window library, keyboard scanner, full LOCI API) is complete and tested. Phase 4 — application rebuild — is in progress.

Requirements

Hardware

- Oric Atmos
- LOCI mass storage device
- USB storage connected to LOCI

For emulator testing

- Oricutron emulator

Note: LOCI hardware features (file access, directory listing, mount/unmount) require a real LOCI device. Oricutron does not emulate LOCI.

For building from source

Tool	Purpose	Install
Oscar64	C compiler for 6502	Build from source
Python 3	Tape image wrapper (mktap.py)	<code>sudo apt install python3</code>
pandoc	PDF documentation generation	<code>sudo apt install pandoc</code>
zip	Release archive	<code>sudo apt install zip</code>

Building from source

```
git clone https://github.com/xahmol/locifilemanager-v2
cd locifilemanager-v2
```

Target	Action
<code>make</code>	Build English app (build/locifm.tap)
<code>make LANG=FR</code>	Build French app (build/locifm_fr.tap)
<code>make all-langs</code>	Build all four tap images (EN+FR for app and demo)
<code>make run</code>	Build + launch EN app in Oricutron
<code>make libdemo</code>	Build library demo (build/libdemo.tap)
<code>make libdemo-run</code>	Build + launch EN demo in Oricutron
<code>make docs</code>	Regenerate PDF documentation from Markdown
<code>make zip</code>	Build all images + docs + release ZIP
<code>make usb</code>	Copy all tap images to USB stick (see below)
<code>make clean</code>	Remove build artefacts

USB transfer to real hardware

Copy tap images directly to a mounted USB stick:

1. Copy `.env.example` to `.env` (`.env` is gitignored):

```
cp .env.example .env
```

2. Edit `.env` and set `USBPATH` to the directory on your mounted USB stick where the tap files should land:

```
USBPATH = /media/yourname/USBSTICK/oric
```

3. Mount the USB stick, then run:

```
make usb
```

This builds all four tap images and copies them to `USBPATH`.

Installation

1. Copy `locifm.tap` (English) or `locifm_fr.tap` (French) to your LOCI USB storage.
2. On the Oric, load from the LOCI prompt or via BASIC:

```
CLOAD""
```

Usage

(Application rebuild in progress — this section will be completed in Phase 4.)

The application provides:

- Two-pane directory browser
 - File operations: copy, move, delete, rename
 - Tape image browser
 - Drive management: mount/unmount disk, tape, and ROM images
 - Boot from active mounts (disk priority over tape over ROM)
 - IJK joystick support (Raxiss IJK interface)
 - English and French interface
-

Version history and download

Version	Date	Notes
2.0.0	2026	Oscar64 rebuild — in development
